Exploring Gamma-Ray and Neutron Spectroscopy Missions to Mars Caves

Angelica Berner (LANL, ASU)

Patrick Gasda (LANL), Katherine Mesick (LANL), Craig Hardgrove (ASU)

7/29/2021

Agenda

01

Background

- Review of project conception, GRNS, and Mars caves

02

Project Overview

- Big-picture look at the project and relevant questions

03

Results

- Description of simulation setup and configuration
- Overview of results

04

Conclusions + Future Work

- Summary of conclusions and next steps
- Description of future work

Mount Mercou, ~6m tall

Background

- Mars Caves
 - Collapse chains → subsurface caves¹
 - Good candidates for habitability?
 - Potential to host water resources
 - Shielded from radiation

Project Overview

- **What:** Investigating the sensitivity of active neutron detector systems in Mars caves
- **How:** Using MCNP6 to model neutron transport in different cave geometries, compositions, and detectors
- **Why:** To determine if active neutron measurements can be used to identify the hydration of cave walls vs floor vs ceilings, and to perform a concept study for potential future Mars cave missions in search of hydration and habitable regions

Results: Detectors on the Surface

- Box of air
 - Basic Mars atmosphere composition
- Box of planetary material
 - Crust+Mantle Mixture (Taylor, 2013)
- Detectors
 - Maintain same position from Curiosity model
 - Center of surface box

Results: Detectors on the Surface

Results: Simple Cave Model

- Geometry:
 - Hemisphere
- Composition:
 - Crust+Mantle mixture (Taylor, 2013)
 - Surrounding material is uniform
- Detectors:
 - Location varies (approaches wall)

Results: Simple Cave Model

Results: Ceiling H2O Content Varies ($z=9$)

- How does detector response change when only the top few meters of the cave ceiling change in composition?

Results: Ceiling H2O Content Varies (z=9)

Results: Ceiling H2O Content Varies ($z=0$)

- How does detector response change when the ceiling is defined as everything above $z=0$?

Results: Ceiling H2O Content Varies (z=0)

Results: Ceiling H2O Content Varies (z=0)

Results: Detectors on the Surface Near a Wall

- Wall added to surface model
 - 5m away, 6m tall

Results: Detectors on the Surface Near a Wall

Conclusions

- Initial results show that later time bins hold valuable information that allows us to discriminate between the ceiling and the wall of the cave
 - Particularly sensitive to composition and distance
- Immediate next steps:
 - Finish varying ceiling height runs
 - Explore and quantify the contribution of the wall to the cave response by varying detector distance on the surface
 - Look for possible second peak in real DAN data

Future Work

- Change the model geometry (steeper walls?)
- Change the detectors
- Acquire real data
 - BRAILLE team but with GRNS!
